The SELFTAC® pearl: four heroes

Static hero variations with the reversible linker's join drawn as one realistic pearl. Numbers match the variations page.

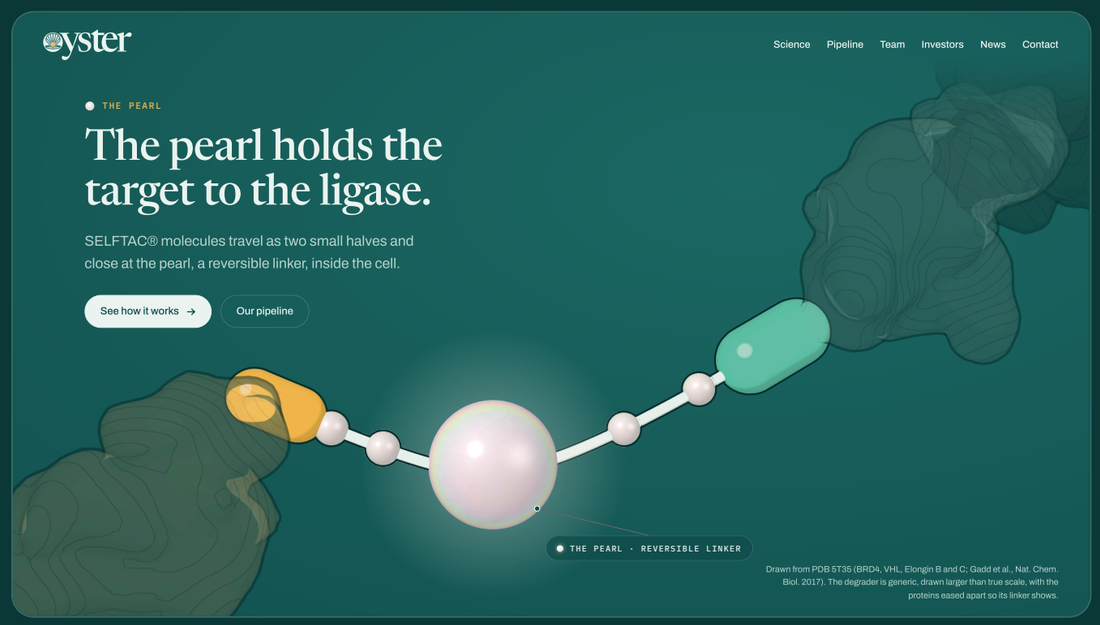

01 Detailed

The traced ends of the degrader in their pockets, as on the Science page; the join is now the pearl.

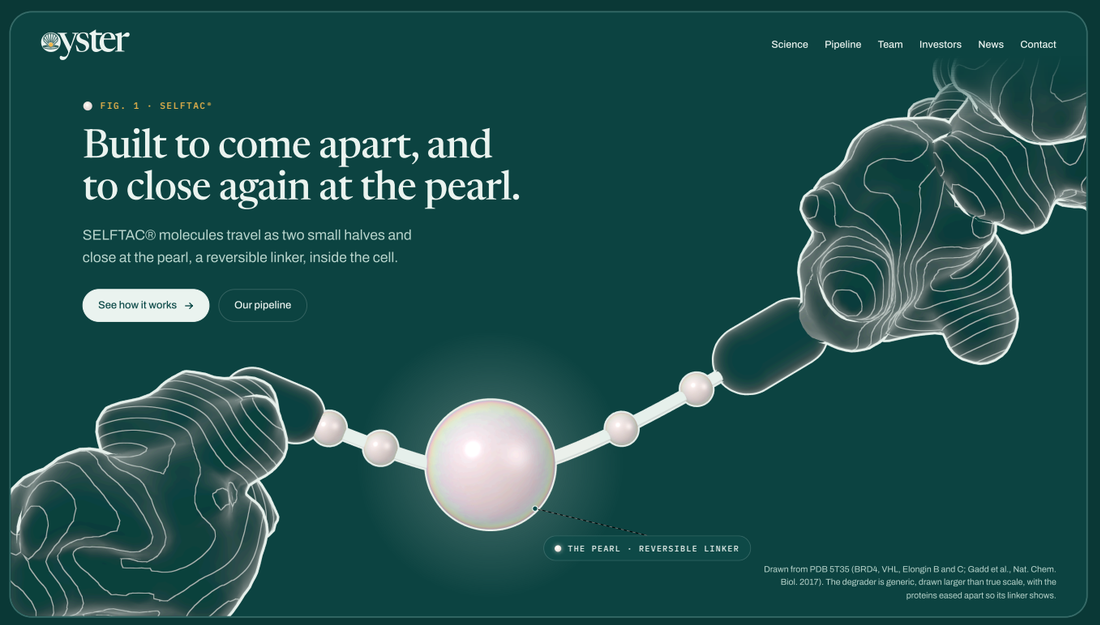

03 Silhouette

The proteins as flat shapes with no contour lines, so the only texture in the picture is the pearl's.

04 Ghost

The proteins see-through, as if out of focus; the degrader and its pearl are the solid things.

05 Blueprint

Line-work on a drafting grid: the proteins and the degrader are drawn, only the pearl is rendered.

Rendered from the website's own 3D models. The degrader is generic and stands in for a SELFTAC® compound; it is drawn larger than true scale, with the proteins eased apart so its linker shows. Structures: BRD4, VHL and Elongin B and C from PDB 5T35 (Gadd et al., Nat. Chem. Biol. 2017).
